COLABERRY · DEMO FOR SOLICITATION 90MC26R0004

SSS Modernization Demo

A working platform for the Selective Service System's registrant services: online accounts, exemption eligibility, case management with appeals, and automatic compliance checks on every decision.

Demo site sss-demo-frontend.onrender.com Status as of **October 12, 2026**

Working in the demo **2 of 5 R0 stories, 7 of 11 R1 stories**

> Everything described here is demonstrated on a synthetic demo deployment; none of it is operating in production. Synthetic data only. The exemption types shown (A senior, B income, C hardship) are illustrative rules built to exercise the workflow. They are not Selective Service policy.

WHAT THE APP IS FOR

One place to register, apply, decide and prove it

The Selective Service System keeps the national registry that federal law requires nearly every man living in the United States to join between the ages of 18 and 25. Registration status follows people for years: it can affect eligibility for federal jobs and some state programs, so registrants, agencies and staff all need fast, accurate answers.

This demo modernizes the business systems behind that work: online registration and registrant records, profile updates with compliance checks, exemption and appeal case management, compliance verification, and reporting. It shows the user experience and the controls together, so evaluators can see how the proposed approach works in practice rather than on paper.

Registrants and applicants

Create an account, keep their profile current, see which exemptions they qualify for and why, apply, follow every step of their case, and appeal a denial.

Case managers

Work a queue of applications, take ownership, decide with a stated reason, keep internal notes, and export case lists for reporting.

Compliance and leadership

See whether decisions follow the rules, review any that do not, and search two audit logs: every control result, and every sign-in, refusal, data access and change.

CHALLENGES IT SOLVES

The problems this platform addresses

Registrants can't see where they stand People need to register, update their details and know the status of a request without calling or mailing anyone.	Self-service accounts, a profile with a built-in compliance check, eligibility results with a plain-language reason for each, a case timeline and in-app notifications at every status change.	IN THE DEMO
Decisions that are hard to explain or challenge Applicants deserve to know why they were refused and how to respond.	Rules produce a status and a reason for every exemption type. A denial cannot be saved without a written reason, which the applicant sees, and a denied applicant can appeal from the same page.	IN THE DEMO
No proof that each decision followed the rules Oversight needs evidence for every decision, not a sample.	Every approval and denial is checked against 8 decision controls the moment it is made. A failure opens a review that only a different case manager can resolve, with a written justification. A dashboard tracks the rate against a 99% target.	IN THE DEMO

Sensitive personal data at risk Social Security numbers and case records must be protected and only seen by the right people.	SSNs are stored only as one-way hashes, never shown back or logged, and entered in a masked field. Every page of the API declares who may use it, an automated test fails the build if any route lacks its access check, and every read, export and refusal goes into a write-once security audit log.	IN THE DEMO
Case work spread across inboxes and spreadsheets Staff need one queue with clear ownership.	A shared case queue with status counts, filters, assignment, internal notes, document links and CSV export that never includes SSNs.	IN THE DEMO
Screens that show stale data Dashboards and case pages must show current information within seconds of a change.	Every profile save, eligibility check, application and case change is timed until the next request can read it. Staff see each data type against a 30-second target for 95% of updates, an alert when one falls behind, and the slowest updates.	IN THE DEMO
Screens some people cannot use Every screen must work for people using assistive technology (Section 508).	Every page is checked against WCAG 2.1 AA, which includes Section 508, signed out, as an applicant and as a case manager. It works by keyboard with a skip link, screen readers hear each field by its name with its errors, contrast is at least 4.5:1, nothing is lost at 320 pixels, a session warns before it ends, and applications are confirmed before they are sent.	IN THE DEMO
Hosting that meets federal requirements Production must run on FedRAMP-authorized cloud with multi-factor sign-in.	The demo runs on commercial hosting today. AWS GovCloud infrastructure (STORY-004) waits on approval, and multi-factor sign-in has its server side built with screens to come.	PLANNED

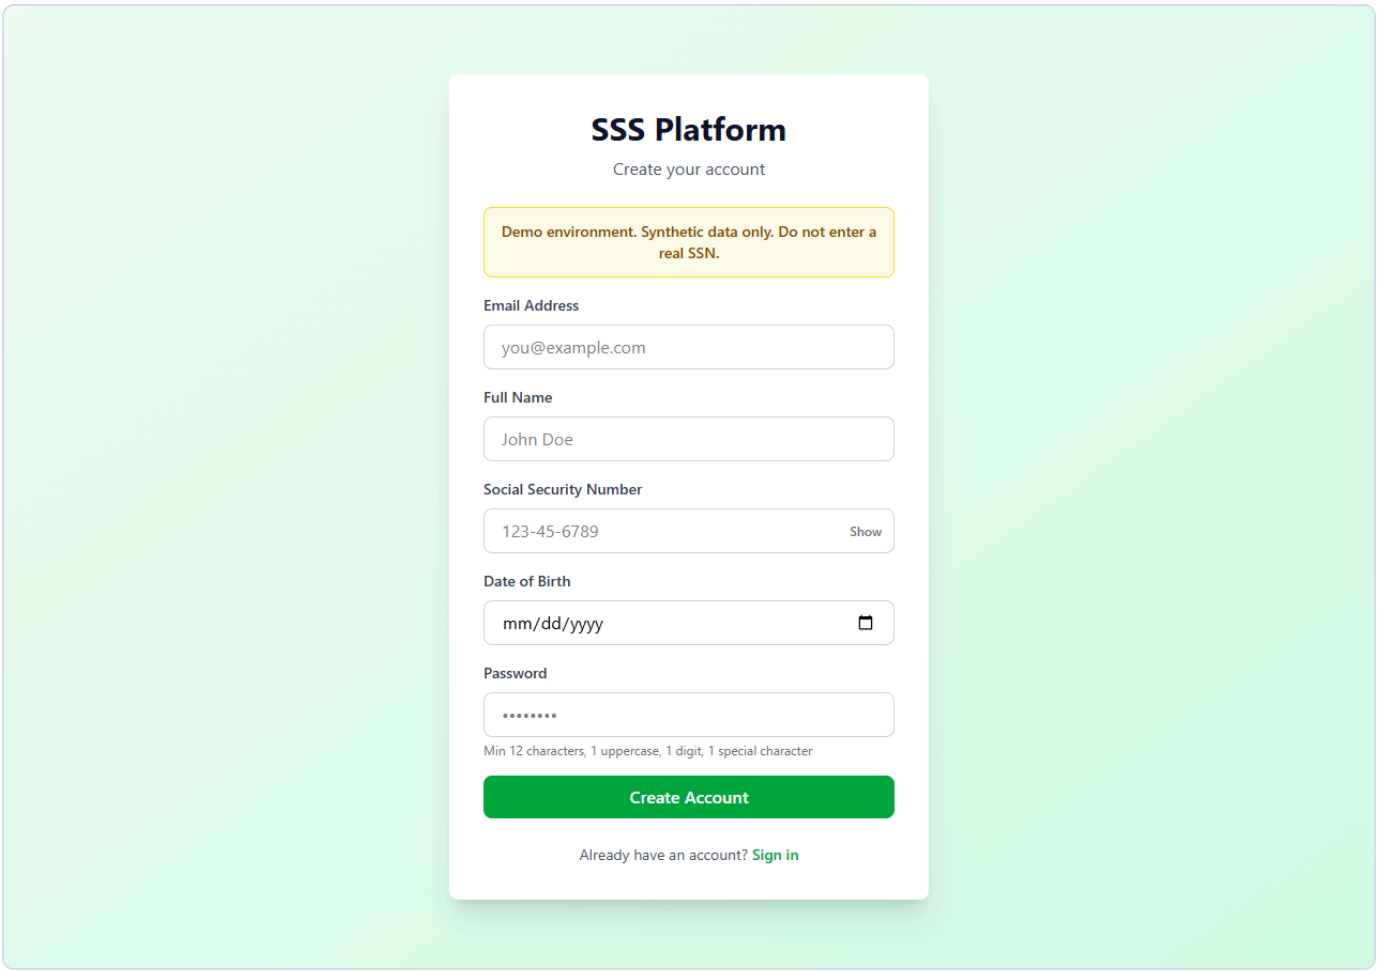

DEMO WALKTHROUGH

Twelve scenes, about fifteen minutes

SCENE 1 ·

A registrant creates an account

- The banner reminds everyone this is synthetic data. The SSN field is masked, with a Show toggle.
- Passwords need 12 characters with a capital, a digit and a symbol. The SSN is hashed before it is stored.

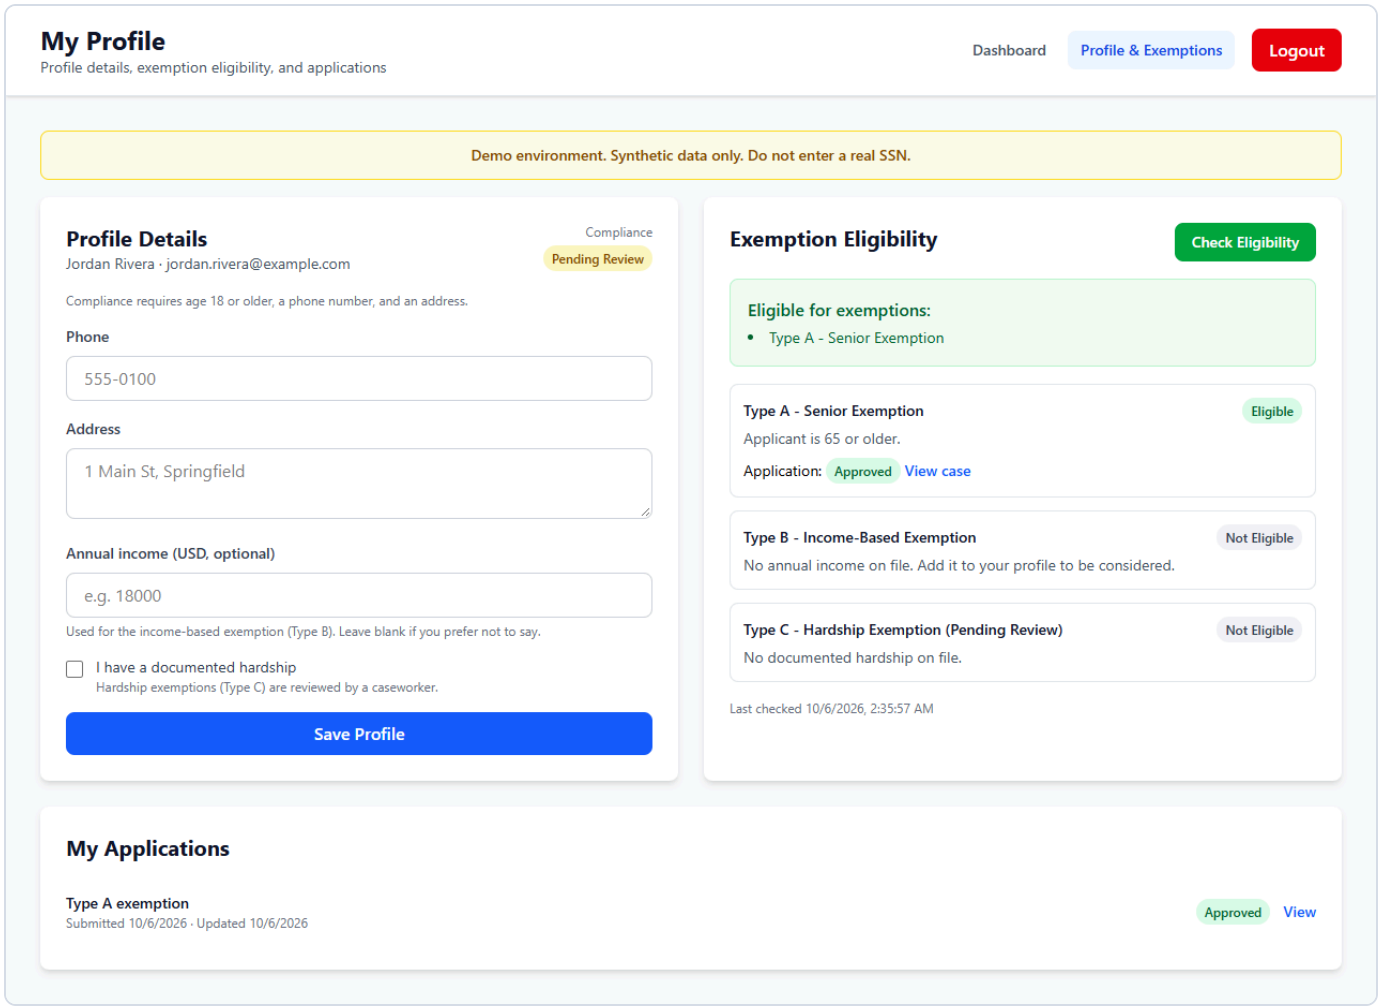

Registration, with the synthetic-data banner and masked SSN entry.

SCENE 2 ·

Eligibility, with a reason for every result

- The profile page checks the registrant's record (18 or older, phone, address) and shows what is missing.

- Each exemption type returns Eligible, Pending Review or Not Eligible with a plain-language

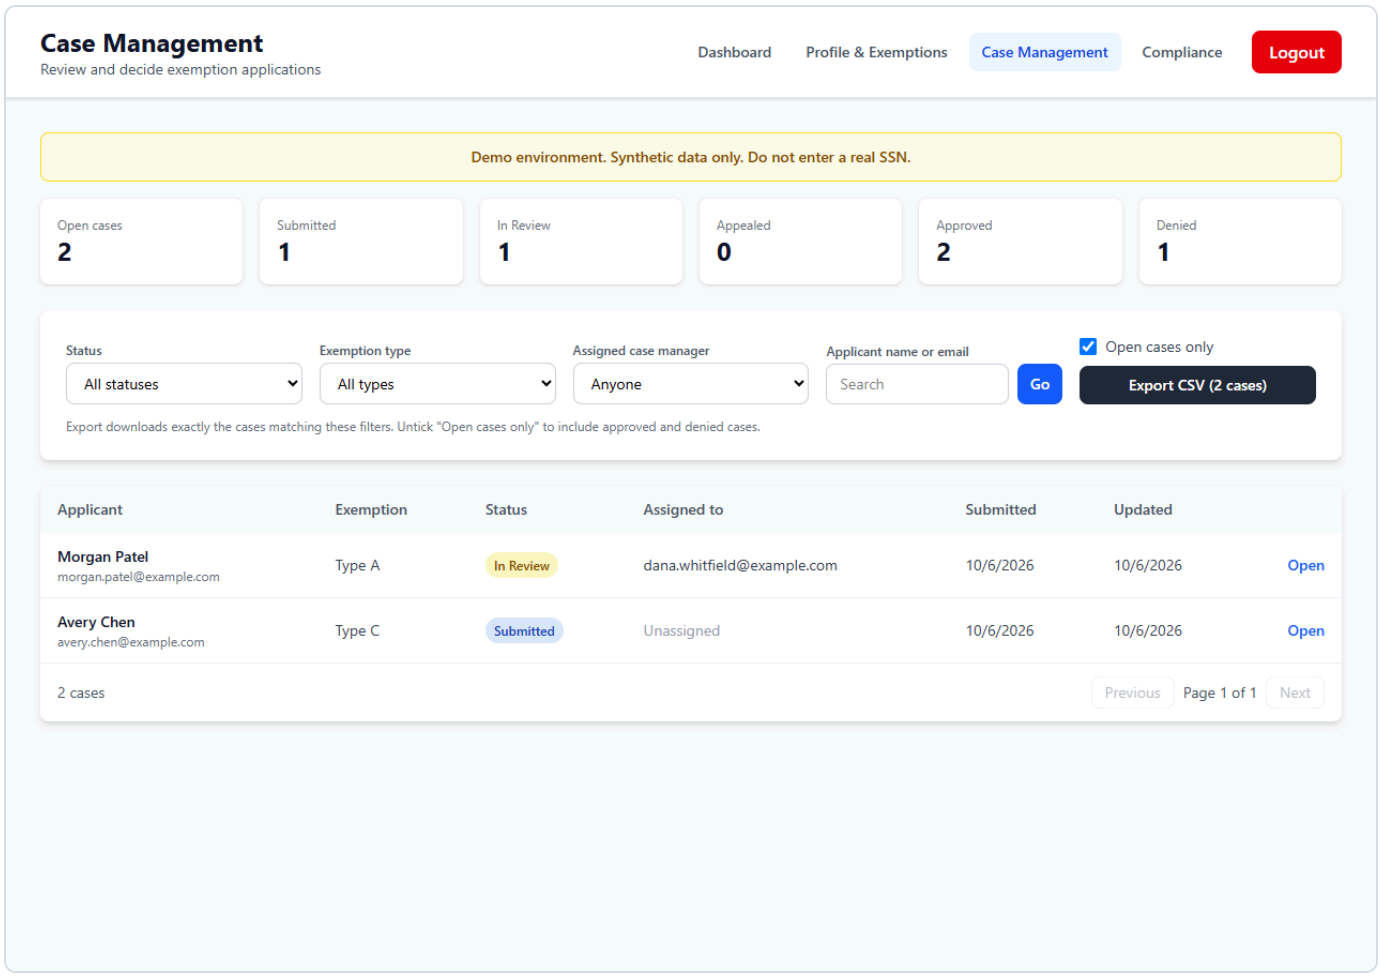

Jordan Rivera qualifies for Type A because the applicant is 65 or older; the other types explain why not.

SCENE 3 ·

Case managers work one queue

- Counts by status, filters by status, type, case manager and applicant, and an export of exactly the filtered cases.
- Each case shows who owns it. Unassigned work is visible at a glance.

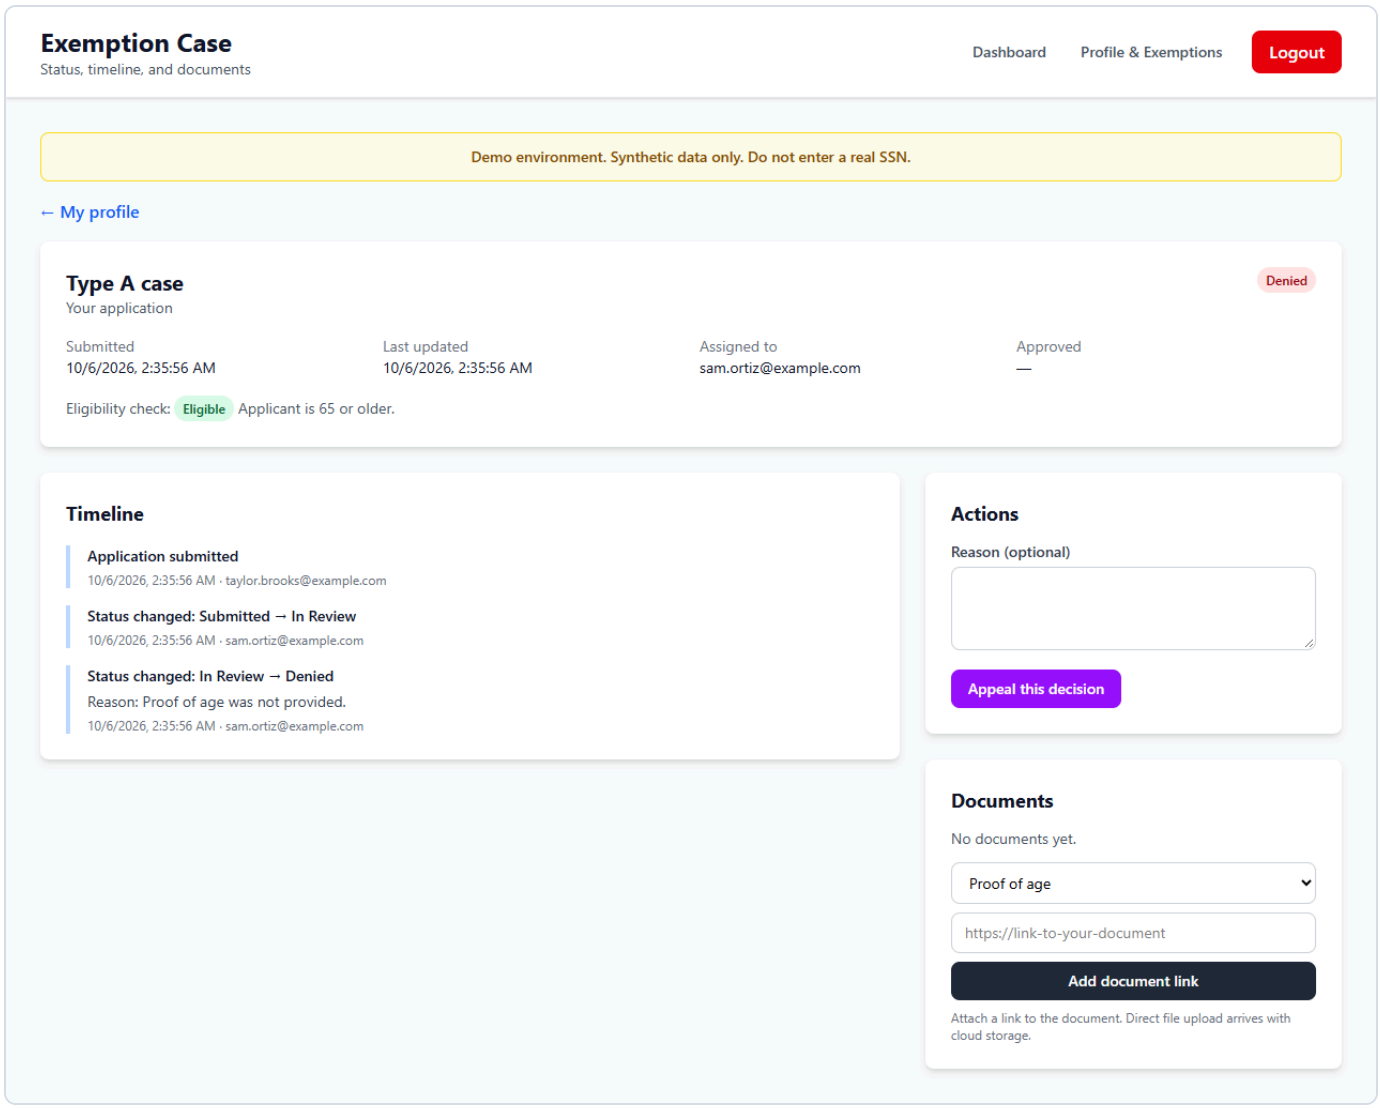

Two open applications: one in review with Dana Whitfield, one newly submitted and unassigned.

SCENE 4 ·

A denial always carries its reason

- The case manager cannot deny without a reason, and the applicant sees it on the timeline.
- The applicant can appeal from the same page, which sends the case back for review.

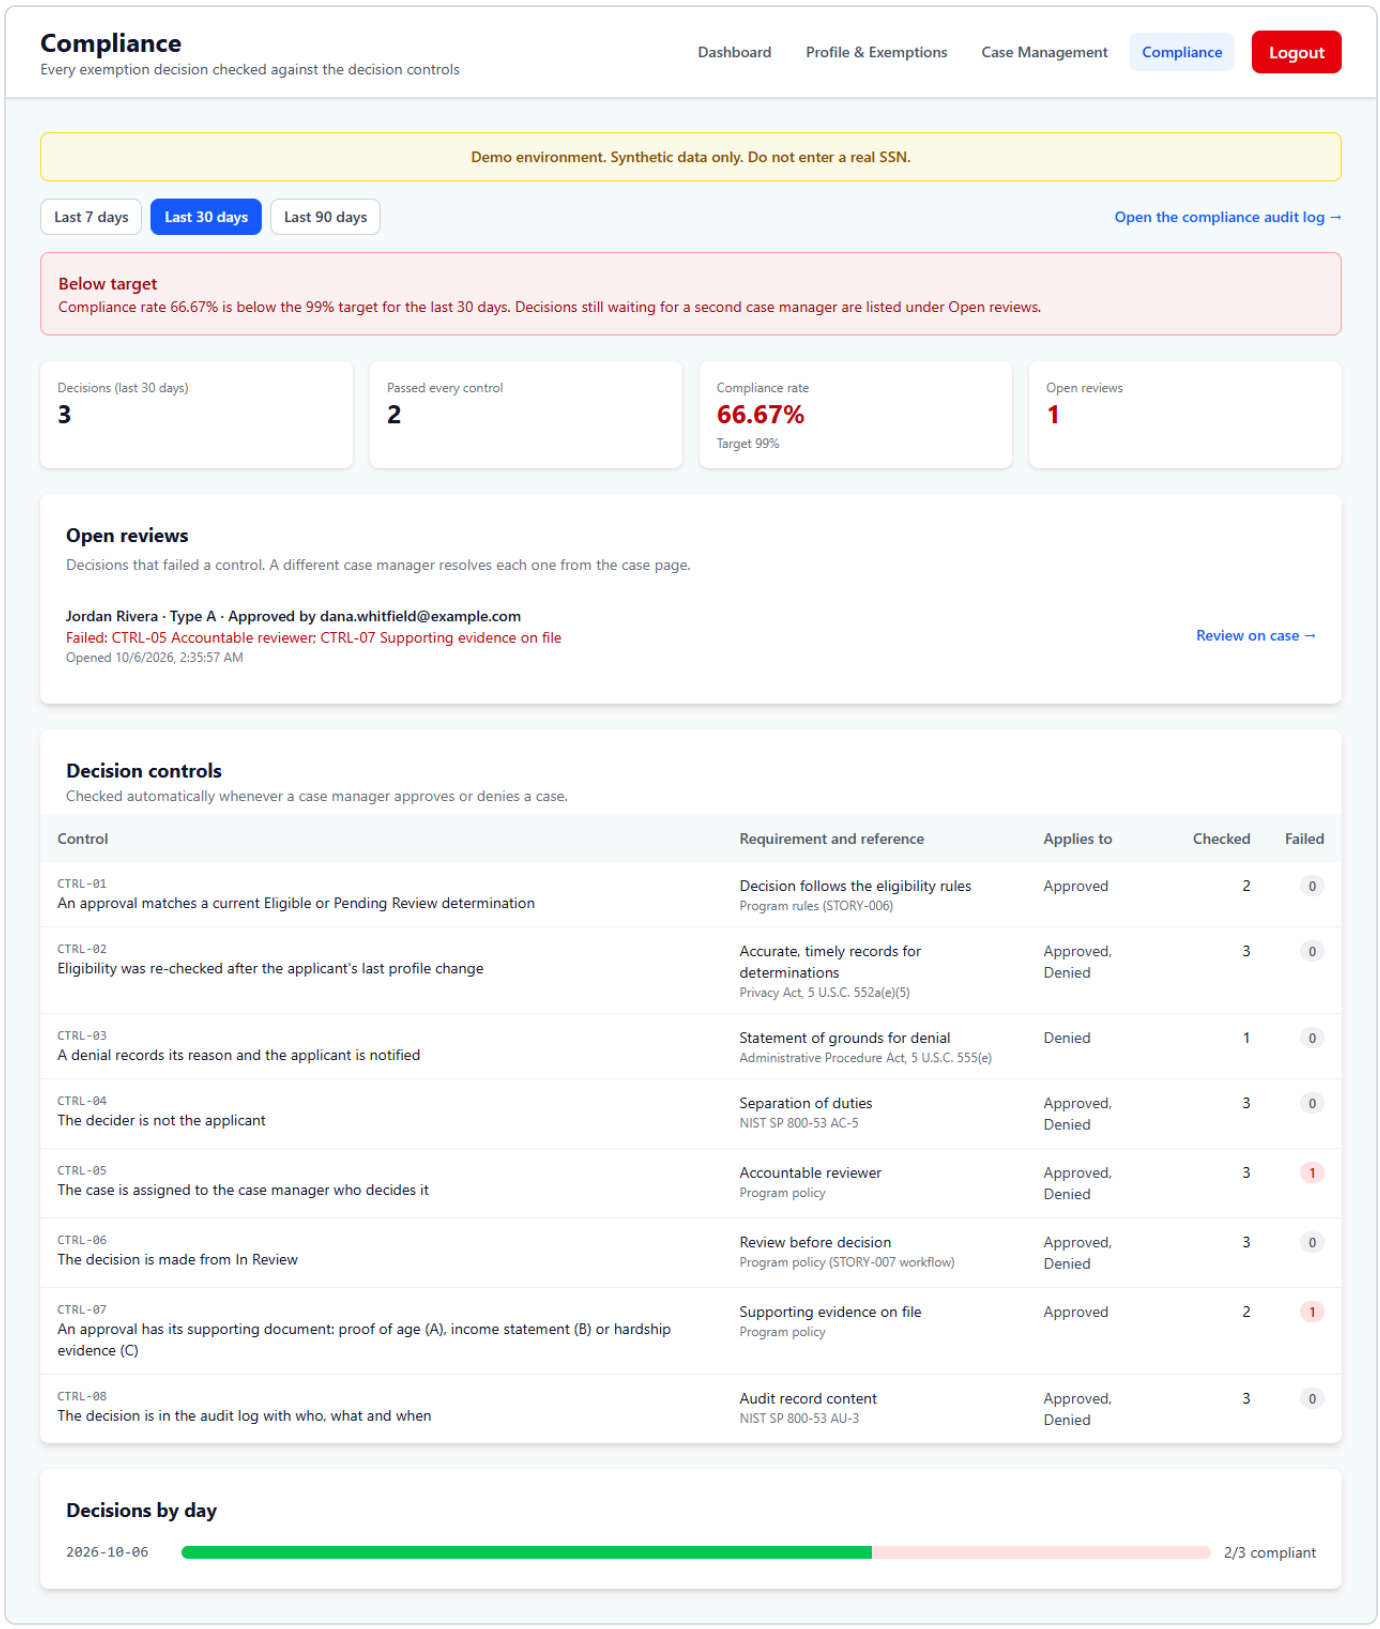

Taylor Brooks sees "Proof of age was not provided." and can appeal.

SCENE 5 ·

Every decision is checked automatically

- When a case is approved or denied, 8 controls run at once: eligibility basis, a fresh eligibility check, reason and notice, separation of duties, ownership, review before decision, required document and an audit entry.
- Here one of three decisions failed two controls, so the rate is 66.67% against the 99% target and the dashboard raises an alert.

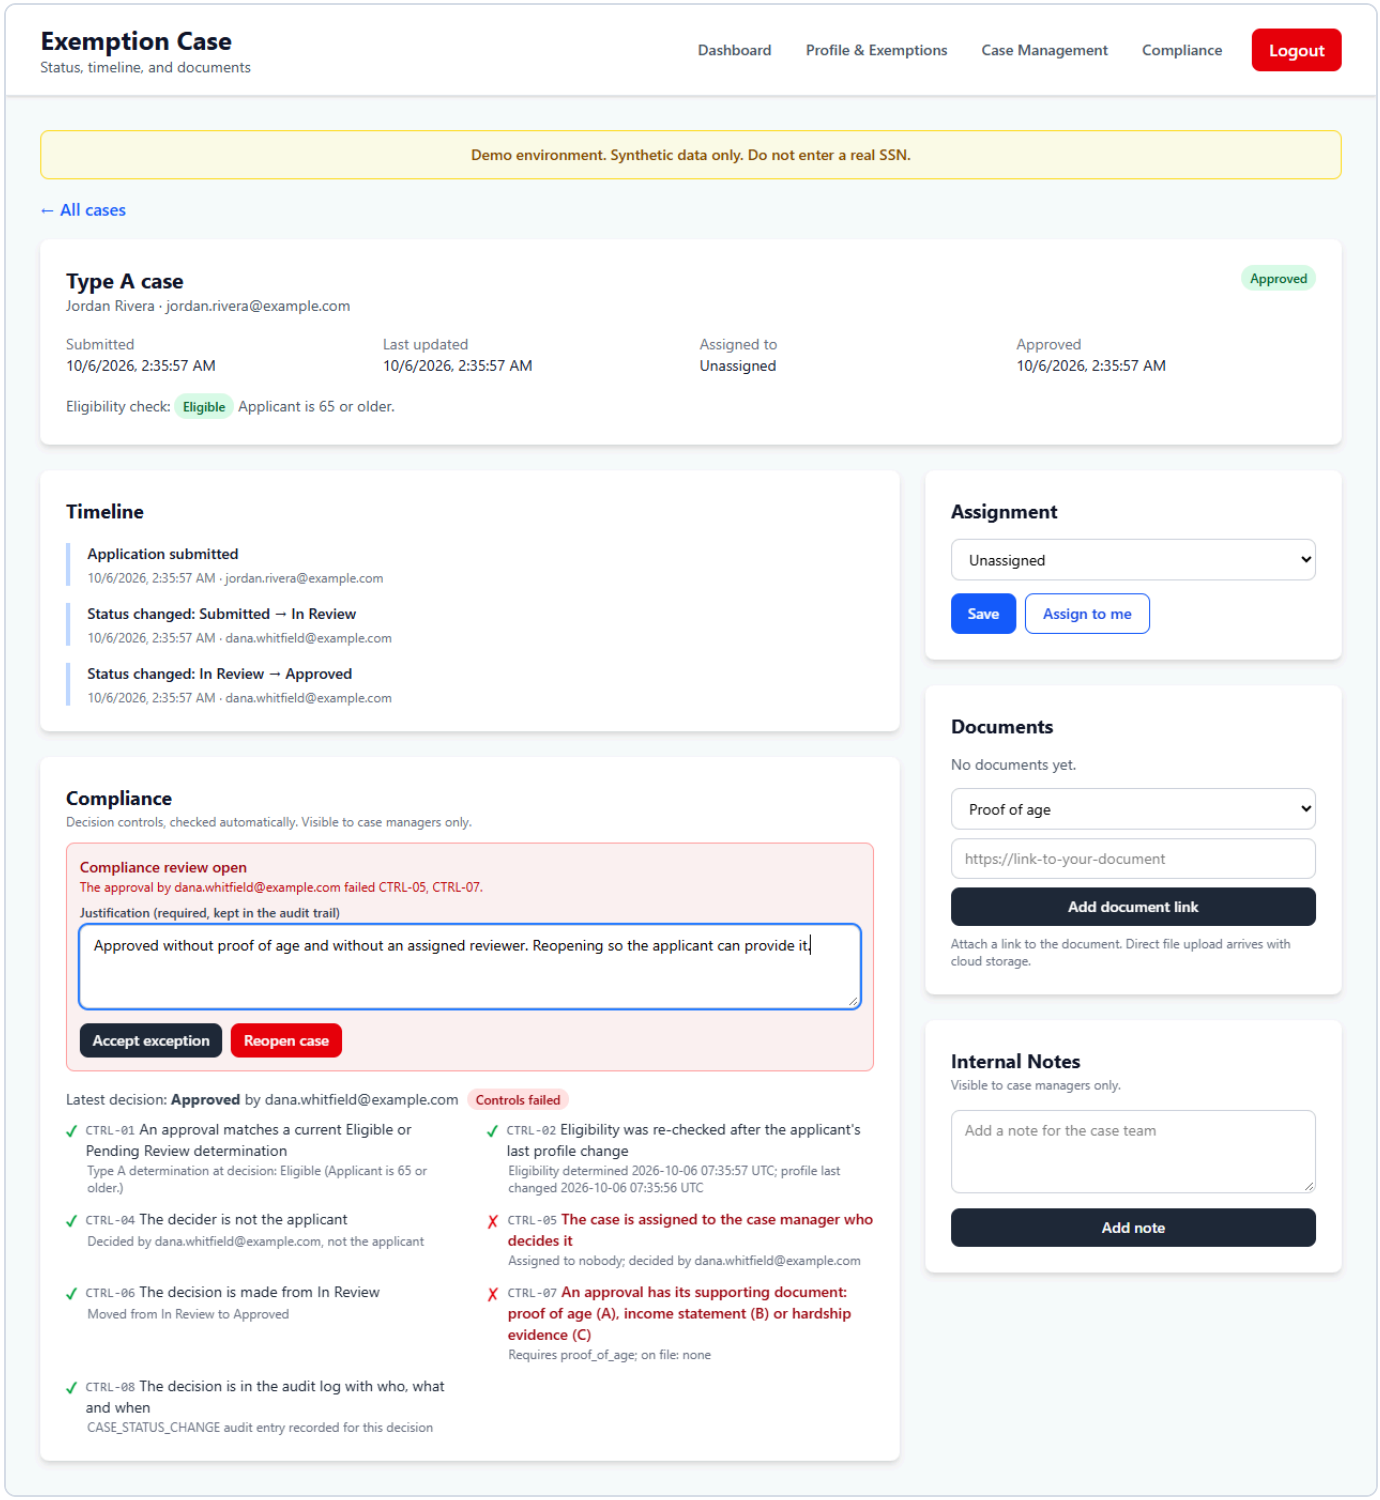

The compliance dashboard: rate against target, open reviews, and failures per control with their legal or policy basis.

SCENE 6 ·

A second case manager reviews the failure

- The case was approved while unassigned and without proof of age. The case page lists each control with its evidence.
- The manager who decided cannot clear their own review. A different manager must write a justification, then either accept the exception (logged as an override) or reopen the case, which notifies the applicant.

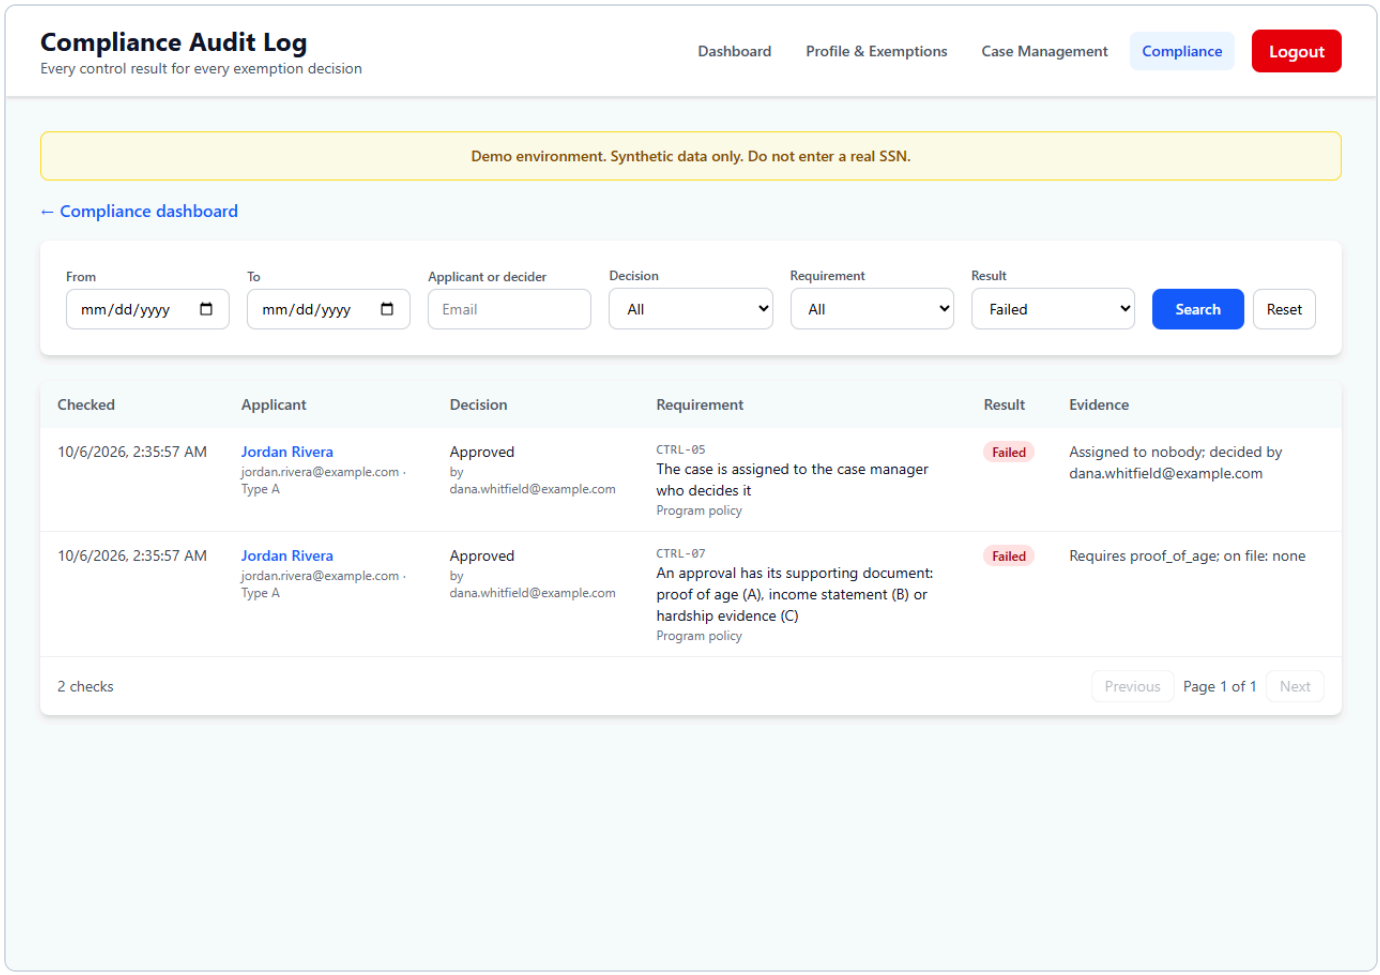

Sam Ortiz reviews Dana Whitfield's approval and reopens it with a written reason.

SCENE 7 ·

Auditors search every control result

- Filter by date range, applicant or decider, decision, control and result.
- Failed decisions stay in the record even after review, so the history cannot be tidied up afterwards.

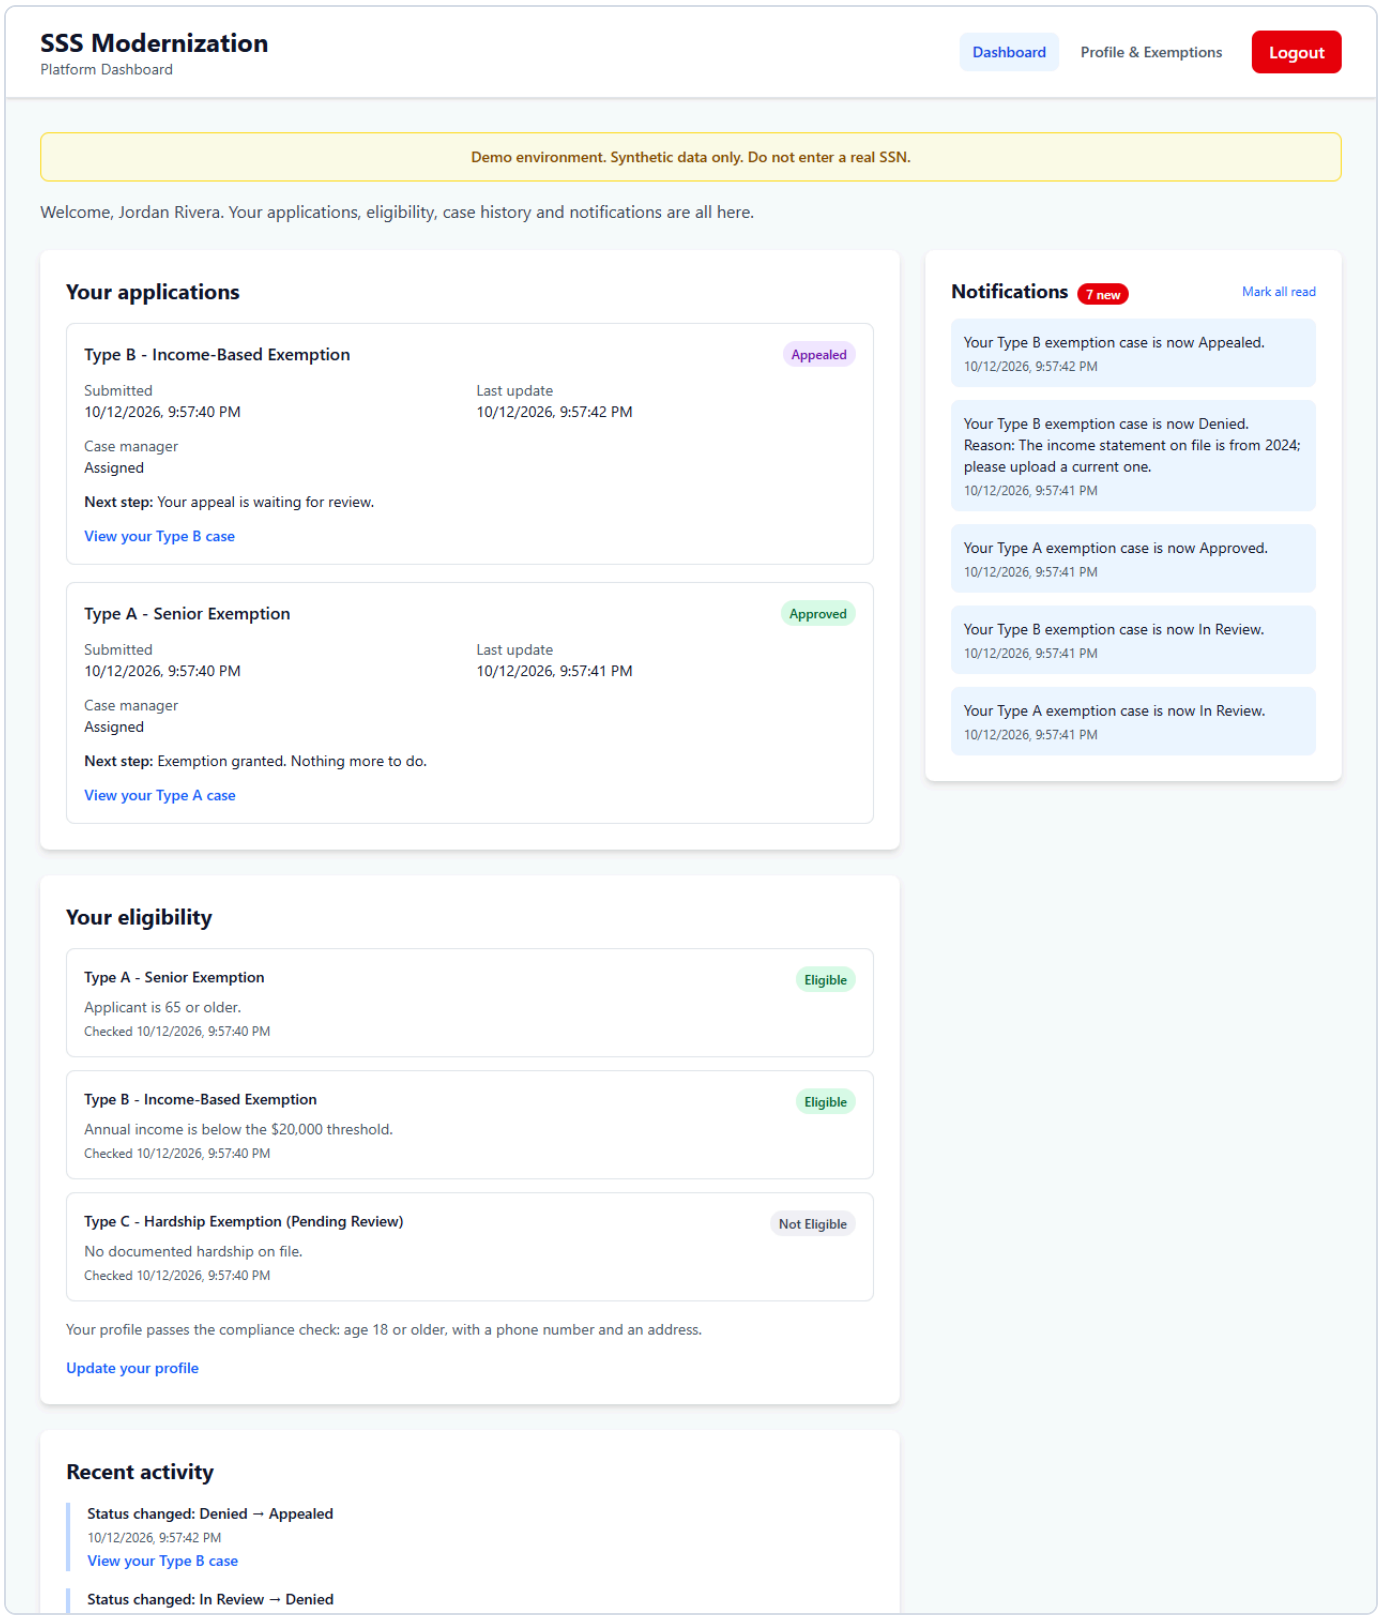

The audit log filtered to failures: the two controls the first decision missed.

SCENE 8 ·

The applicant sees everything in one place

- The dashboard lists each application with its status and the next step, the eligibility result for each exemption with its reason, the latest events across all cases, and notifications.
- Applicants never see internal notes, assignments or compliance details; the dashboard and the case page share one rule for what an applicant may see.

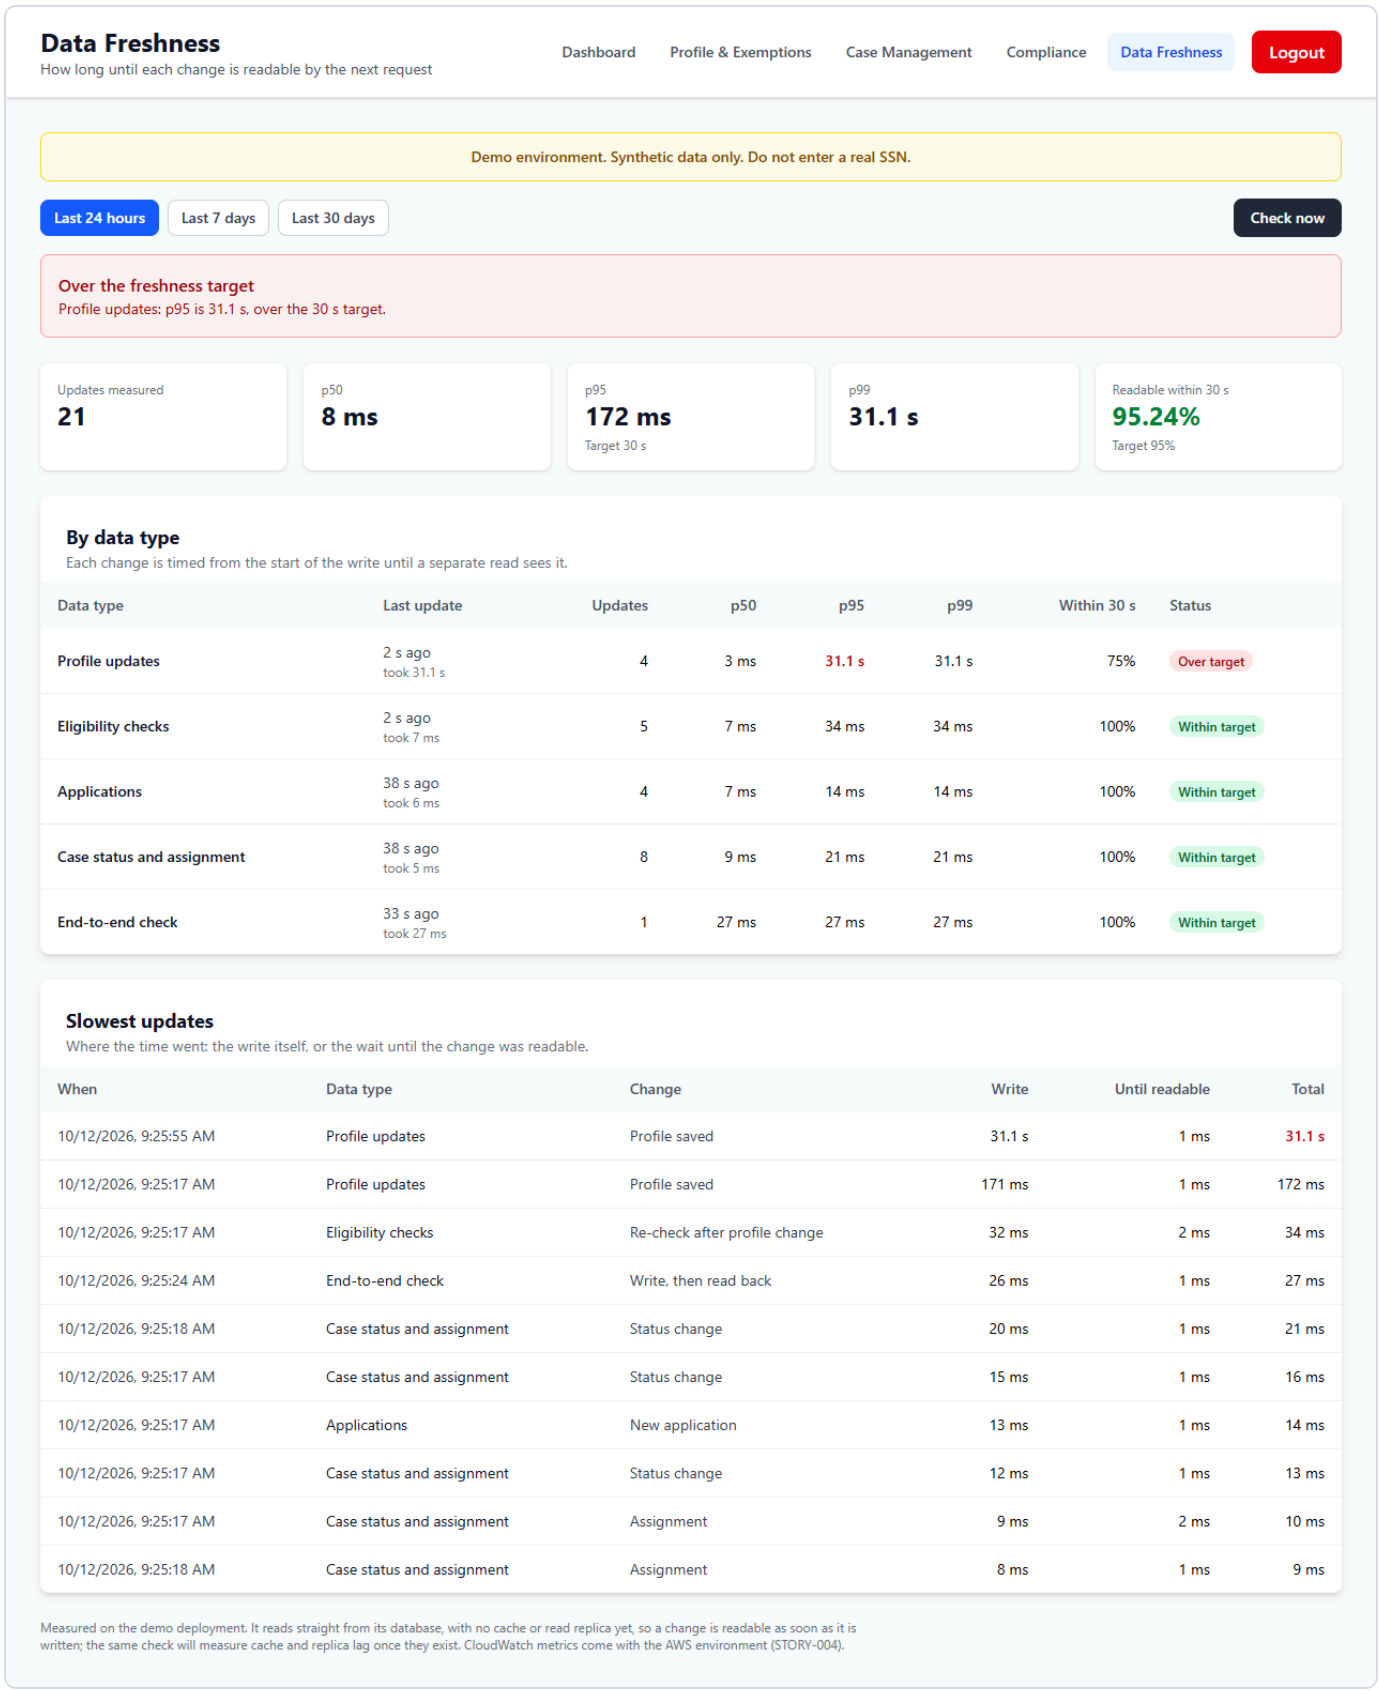

Jordan Rivera's dashboard: Type A approved, Type B appealed after a denial, each with its next step, and eligibility with reasons.

SCENE 9 ·

Every change is timed until it is readable

- Each profile save, eligibility check, application and case change is timed from the start of the write until a separate read sees it, the way the next request would.
- The target is 30 seconds for 95% of updates. Here one profile save waited 31 seconds on a database row held locked by another transaction, so profile updates went over target and the page raised the alert. The slowest-updates list shows the time went into the write.
- Check now times a write end to end from the browser and separates server time from network time.

After a real slowdown: profile updates' p95 is 31.1 s, over the 30 s target; every other data type is measured in milliseconds.

SCENE 10 ·

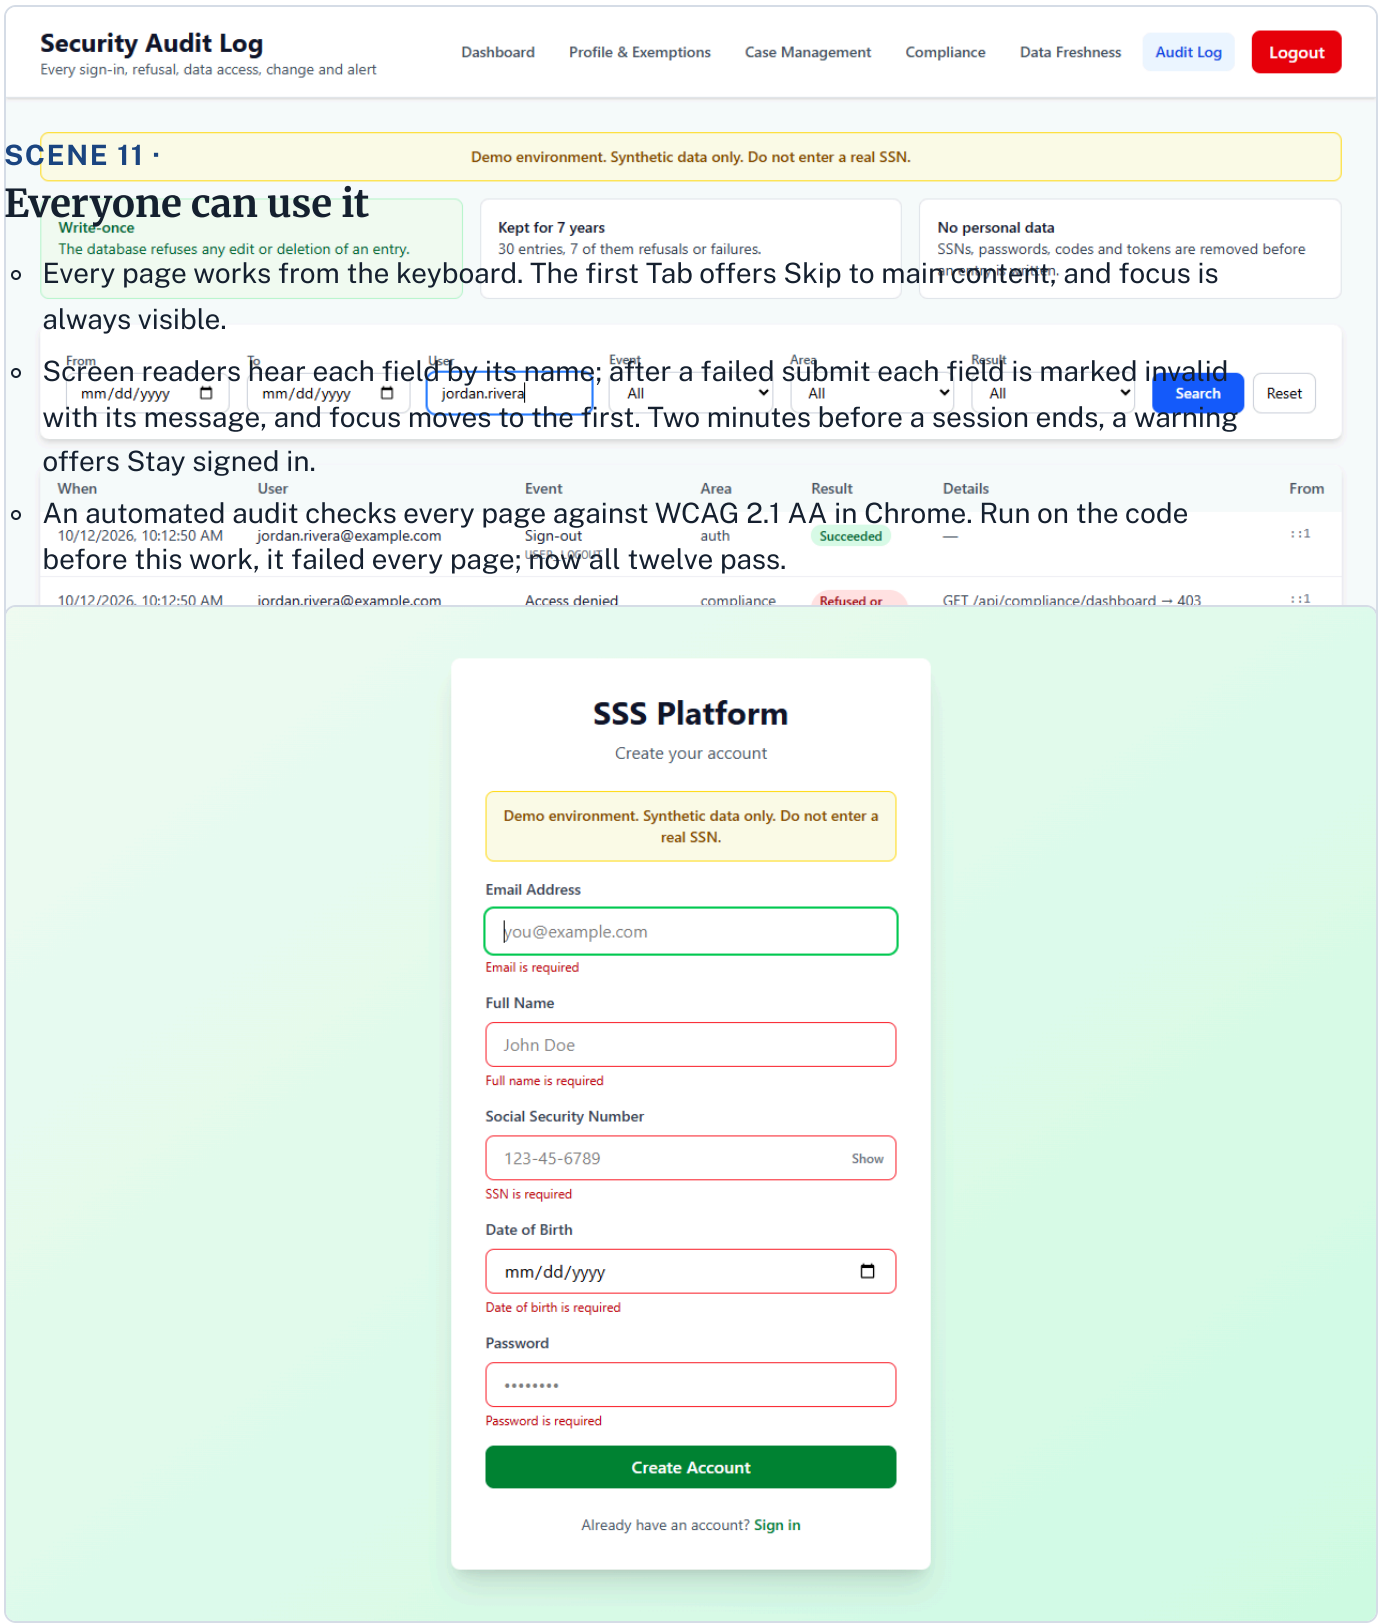

Every security event is on the record

- Sign-ins, including failed ones filed under the address tried, sign-outs, refusals, reads, exports, profile changes, decisions, role grants, deployments and configuration changes, each with who, when and from where.
- The database refuses to edit or delete an entry, even for its owner, and keeps each one seven years. SSNs, passwords, codes and secrets never enter the log; a profile change lists the fields, not the values.

SCENE 11 ·

Everyone can use it

- Every page works from the keyboard. The first Tab offers Skip to main content, and focus is always visible.
- Screen readers hear each field by its name; after a failed submit each field is marked invalid with its message, and focus moves to the first. Two minutes before a session ends, a warning offers Stay signed in.
- An automated audit checks every page against WCAG 2.1 AA in Chrome. Run on the code before this work, it failed every page; now all twelve pass.

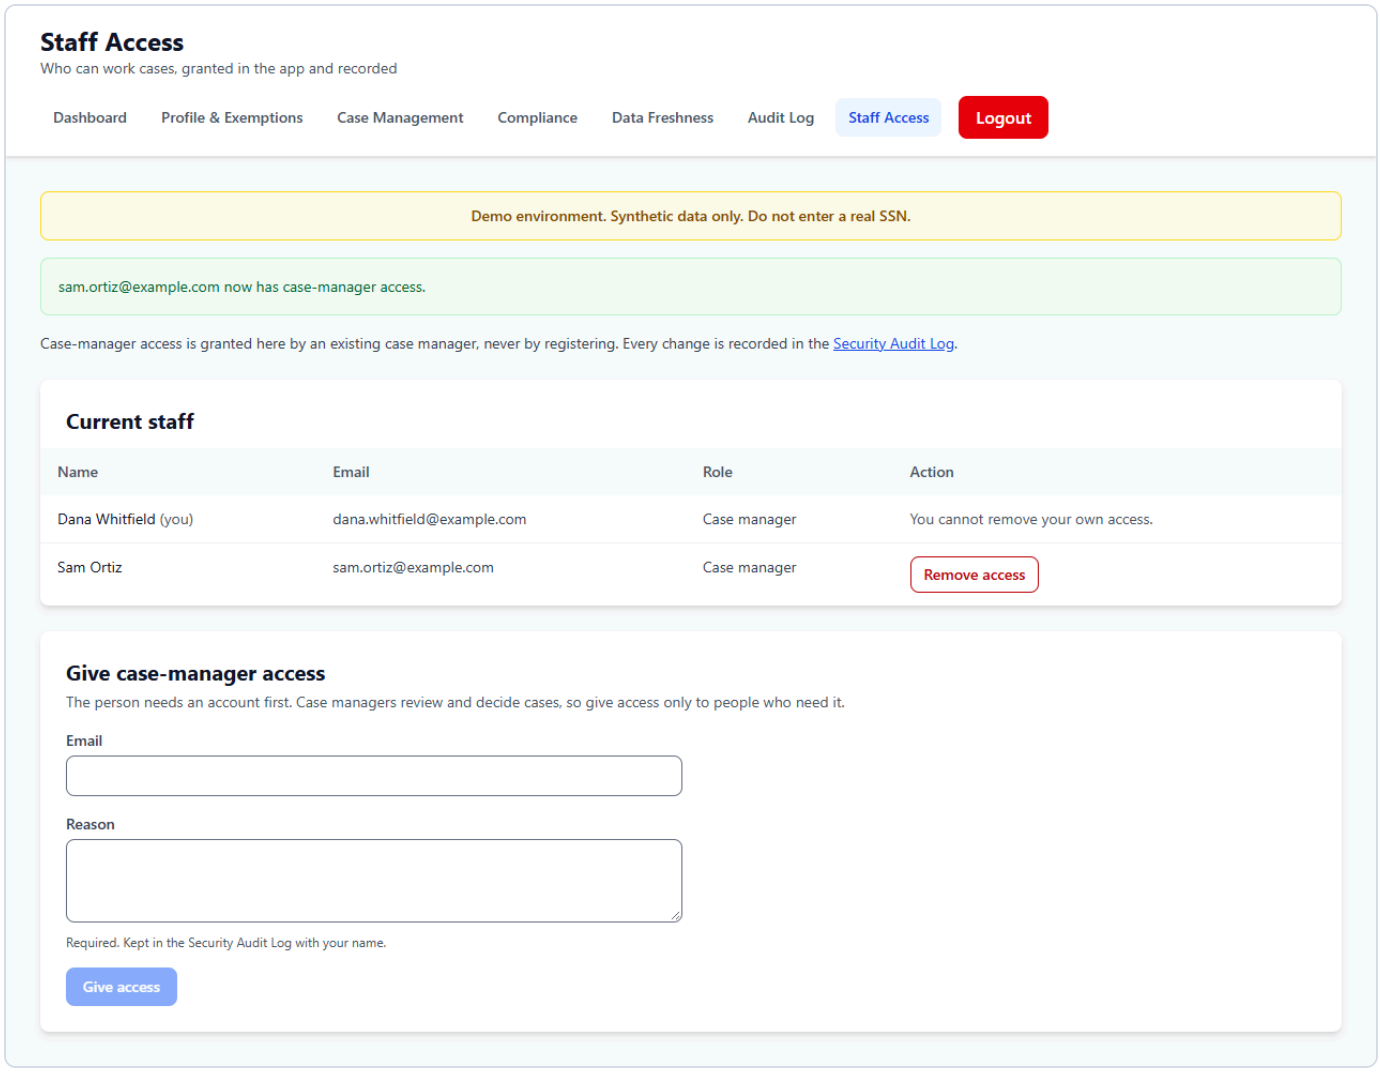

Registration after an empty submit: each field is marked invalid and described by its message, and focus is on the first one.

SCENE 12 ·

Staff access is granted, never claimed

- Case-manager access is given in the app by an existing case manager, with a required reason. Registering an address no longer makes anyone staff.
- Nobody can remove their own access or the last case manager's. Every change is recorded in the Security Audit Log, and the person is notified.

Dana Whitfield has given Sam Ortiz case-manager access, with a reason; the change is in the audit log.

DECISION CONTROLS

What every decision is checked against

Control	What is checked	Basis	Applies to
CTRL-01	The approval matches a current Eligible or Pending Review determination	Program eligibility rules	Approvals
CTRL-02	Eligibility was re-checked after the applicant's last profile change	Privacy Act, 5 U.S.C. 552a(e)(5): accurate, timely records	All decisions
CTRL-03	A denial records its reason and the applicant is notified	Administrative Procedure Act, 5 U.S.C. 555(e)	Denials
CTRL-04	The person deciding is not the applicant	NIST SP 800-53 AC-5, separation of duties	All decisions
CTRL-05	The case is assigned to the case manager who decides it	Program policy: an accountable reviewer	All decisions
CTRL-06	The decision is made from In Review	Program policy: review before decision	All decisions
CTRL-07	The required document is on file: proof of age, income statement or hardship evidence	Program policy: supporting evidence	Approvals
CTRL-08	The decision is in the audit log with who, what and when	NIST SP 800-53 AU-3, audit record content	All decisions

SECURITY AND TRUST

Built to be checked

- **Protected identity data.** Passwords and SSNs are stored as bcrypt hashes. The SSN is never returned by the API, never written to logs and left out of every export.
- **Access decided per endpoint.** Each route declares whether it is public, for signed-in users, for the record's owner or for staff. A test fails the build when a route is missing its rule or its check.

- **Separation of duties.** Case managers cannot decide their own cases or clear reviews of their own decisions.
- **Staff access granted, not claimed.** Case-manager access is given in the app by an existing case manager with a reason, never by registering an address; nobody can change their own access, and every change is in the audit log.
- **Accessible by design.** Every page is checked against WCAG 2.1 AA (Section 508) for each kind of user: keyboard, screen-reader names and errors, contrast, reflow at 320 pixels, a session warning, and confirmation before an application is sent.
- **Write-once audit trail.** Every sign-in, refusal, data read, export, change, role grant, deployment and configuration change is recorded with who, when and from where, alongside every compliance result. The database refuses edits and deletions, entries are kept seven years, and no SSN, password or secret is written to the log.
- **Verified releases.** After each deploy the team checks the demo deployment automatically: the running version, the database, all protected routes refusing anonymous requests, and every staff route refusing an ordinary registrant. Each story ships with screenshots and a written conclusion.

STATUS AND ROADMAP

46 stories in four releases

R0 · Walking skeleton

2 of 5 in the demo

Secure registration and sign-in, profile and compliance check. Multi-factor sign-in and the data pipeline are partly built; cloud infrastructure waits on AWS approval.

R1 · Core services

7 of 11 in the demo

In the demo: exemption eligibility, case management, compliance validation, data freshness, security audit logging, accessibility (Section 508), the citizen dashboard. Next: case manager, admin and leadership dashboards, API governance.

R2 · AI and governance

Not started

Policy question answering with cited sources, drift and hallucination monitoring, human-in-the-loop review, override tracking and bias testing.

R3 · Scale and launch

Not started

Load testing for 10,000 users, sub-2-second responses, multi-region failover, training, runbooks, penetration test, accessibility audit and go-live review.

Colaberry's scope assessment placed current readiness at 33 out of 100 on its INPACT scale; the full program targets 86.

FOR PRESENTERS

Suggested slide outline

1. Title: SSS Modernization Demo, Colaberry, solicitation 90MC26R0004
2. Why it matters: the registry, who depends on accurate registration status

3. The problems: eight challenges and how the platform answers each
4. Who uses it: registrants, case managers, compliance and leadership
5. Registrant journey: account, eligibility with reasons, apply, follow the case (scenes 1, 2 and 8)
6. Case management: one queue, decisions with reasons, appeals (scenes 3 and 4)
7. Compliance by design: 8 controls on every decision, dashboard and target (scene 5 and the control table)
8. Accountability: second-manager review and the audit log (scenes 6 and 7)
9. Current data: every change timed against a 30-second target, with an alert (scene 9)
10. On the record: every sign-in, refusal, read and change in a write-once log (scene 10)
11. Everyone can use it: WCAG 2.1 AA on every page, keyboard and screen readers (scene 11)
12. Who can work cases: staff access granted in the app, never claimed (scene 12)
13. Security and trust: protected SSNs, per-endpoint access, verified releases
14. Status and roadmap: what works in the demo today and what comes next

---

Prepared by Colaberry for the SSS modernization proposal. Screens come from the demo application running the code deployed at sss-demo-frontend.onrender.com, with synthetic people and records. Everything shown is demonstrated on that synthetic deployment, not operating in production. The first visit after a quiet period takes about a minute while the demo server wakes.
